INTRODUCTION

Our business idea is to expand the Clay pottery and sandstone industry by developing an e-commerce website that can connect local artisans with customers at both national and international levels.

Clay Pottery and Sandstone is well-known for its unique handicrafts and cultural heritage, but most artisans face challenges in reaching a larger market. Through this project, we aim to create a simple and user-friendly platform where artisans can showcase their products, and buyers can easily explore, select, and purchase them. This initiative will not only help artisans increase their income but will also promote Indian traditional art and craft globally.

OBJECTIVES

1. To create a dedicated e-commerce platform for Clay pottery and sandstone products.
2. To connect local artisans directly with national and international customers.
3. To provide a simple and user-friendly online shopping experience.
4. To increase the income of Local artists.
5. To Increase the employment opportunities in the pottery & sandstone sector.
6. To promote and preserve Indian traditional art and craft at a global level.

SYSTEM REQUIREMENTS

Hardware Requirements

- Processor: Intel Core i3 / i5
- RAM: Minimum 4GB and (Recommended 8GB)
- Storage: 256GB SSD or 512GB HDD

Software Requirements

- Operating System: Windows 10 / 11 or Linux
- Frontend: HTML, CSS, JavaScript
- Backend: Node.js / PHP
- Database: MySQL
- IDE/ Code Editor: Visual Studio Code (VS Code)
- Browser: Google Chrome, Microsoft Edge, Firefox

MODEL USED

We will be using Prototype Model for our project.

Prototype Model

The prototype model is a software development approach in which an early working version of the system, called a prototype, is created to understand the requirements more clearly. The prototype shows the basic features and design of the system. After getting feedback from users, the prototype is refined and improved until the final system is developed.

Reasons to use Prototype Model

1. Clear Understanding of Requirements – After showing the demo to users/artisans, they clearly state their needs.
2. Reduced Risk of Failure – Building a prototype first helps in understanding and fixing mistakes quickly.
3. Improved System Quality – The final product, which is refined after feedback, becomes more practical and useful.
4. Better Communications – Misunderstanding between the developer and the user are reduced.
5. Flexibility – Changes can be easily made in the prototype without redesigning the entire system.

MODULES

The project is divided into the following modules for better clarity and management:

1. **User Module** –
 - Handles user registration, login, and profile management.
2. **Product Module** –
 - Displays pottery and sandstone products. Admin can add, update, or delete products.
3. **Cart Module** –
 - Allows users to add products to the cart, update quantity, or remove items.
4. **Order Module** –
 - Manages order placement, order history, and order tracking.
5. **Payment Module** –
 - Integrates secure payment options and stores transaction details.
6. **Admin Module** –
 - Provides admin access to manage users, products, and orders.
