# Introduction

Our business idea aims to expand the clay pottery and sandstone industry by developing an e-commerce website that connects local artisans with customers both nationally and internationally.

**Clay pottery and sandstone** are renowned for their unique handicrafts and cultural heritage, yet many artisans struggle to access a broader market.

Through this project, we intend to create a simple, user-friendly platform where artisans can showcase their products, and buyers can easily explore, select, and purchase them.

This initiative will not only help artisans increase their income but also promote Indian traditional art and craft on a global scale.

# OBJECTIVES

- To create a dedicated e-commerce platform for Clay pottery and sandstone products.
- To connect local artisans directly with national and international customers.
- To provide a simple and user-friendly online shopping experience.
- To increase the income of Local artists.
- To Increase the employment opportunities in the pottery & sandstone sector.
- To promote and preserve Indian traditional art and craft at a global level.

# Model Used

## ✦ Prototype Model

The prototype model is a software development approach in which an early working version of the system, called a prototype, is created to understand the requirements more clearly. The prototype shows the basic features and design of the system. After getting feedback from users, the prototype is refined and improved until the final system is developed.

✦ We will be using **Prototype Model** for our project.

## ✦ Reasons to use Prototype Model

1. Clear Understanding of Requirements – After showing the demo to users/ artisans, they clearly state their needs.
2. Reduced Risk of Failure – Building a prototype first helps in understanding and fixing mistakes quickly.
3. Improved System Quality – The final product, which is refined after feedback, becomes more practical and useful.
4. Better Communications – Misunderstanding between the developer and the user are reduced.
5. Flexibility – Changes can be easily made in the prototype without redesigning the entire system.

# Modules

## 1 User Module

- User registration & login
- View and update profile
- Browse artisans & products
- Place orders

## 2 Artisan Module

- Artisan registration & login
- Add pottery/ Sandstone product
- Update product details & stock
- Receive orders
- View ratings & transaction summary
- Account & product approval by admin

## 3 Product Module

- Display all pottery and sandstone products
- Filter by artisan, material, price
- Admin can approve, edit or delete products
- product categories

## 4 Cart & Order Module

- Add to cart
- Update quantity
- Place order
- Track order status(Pending - Confirmed - Delivered)

## 5 Payment Module

- COD/Online Payment options
- Store payment details
- Transaction records for customer & artisan
- Admin verifies payment

## 6 Admin Module

- Approve artisans
- Approve or remove products
- Manage customers and artisans
- monitor orders
- Verify payments

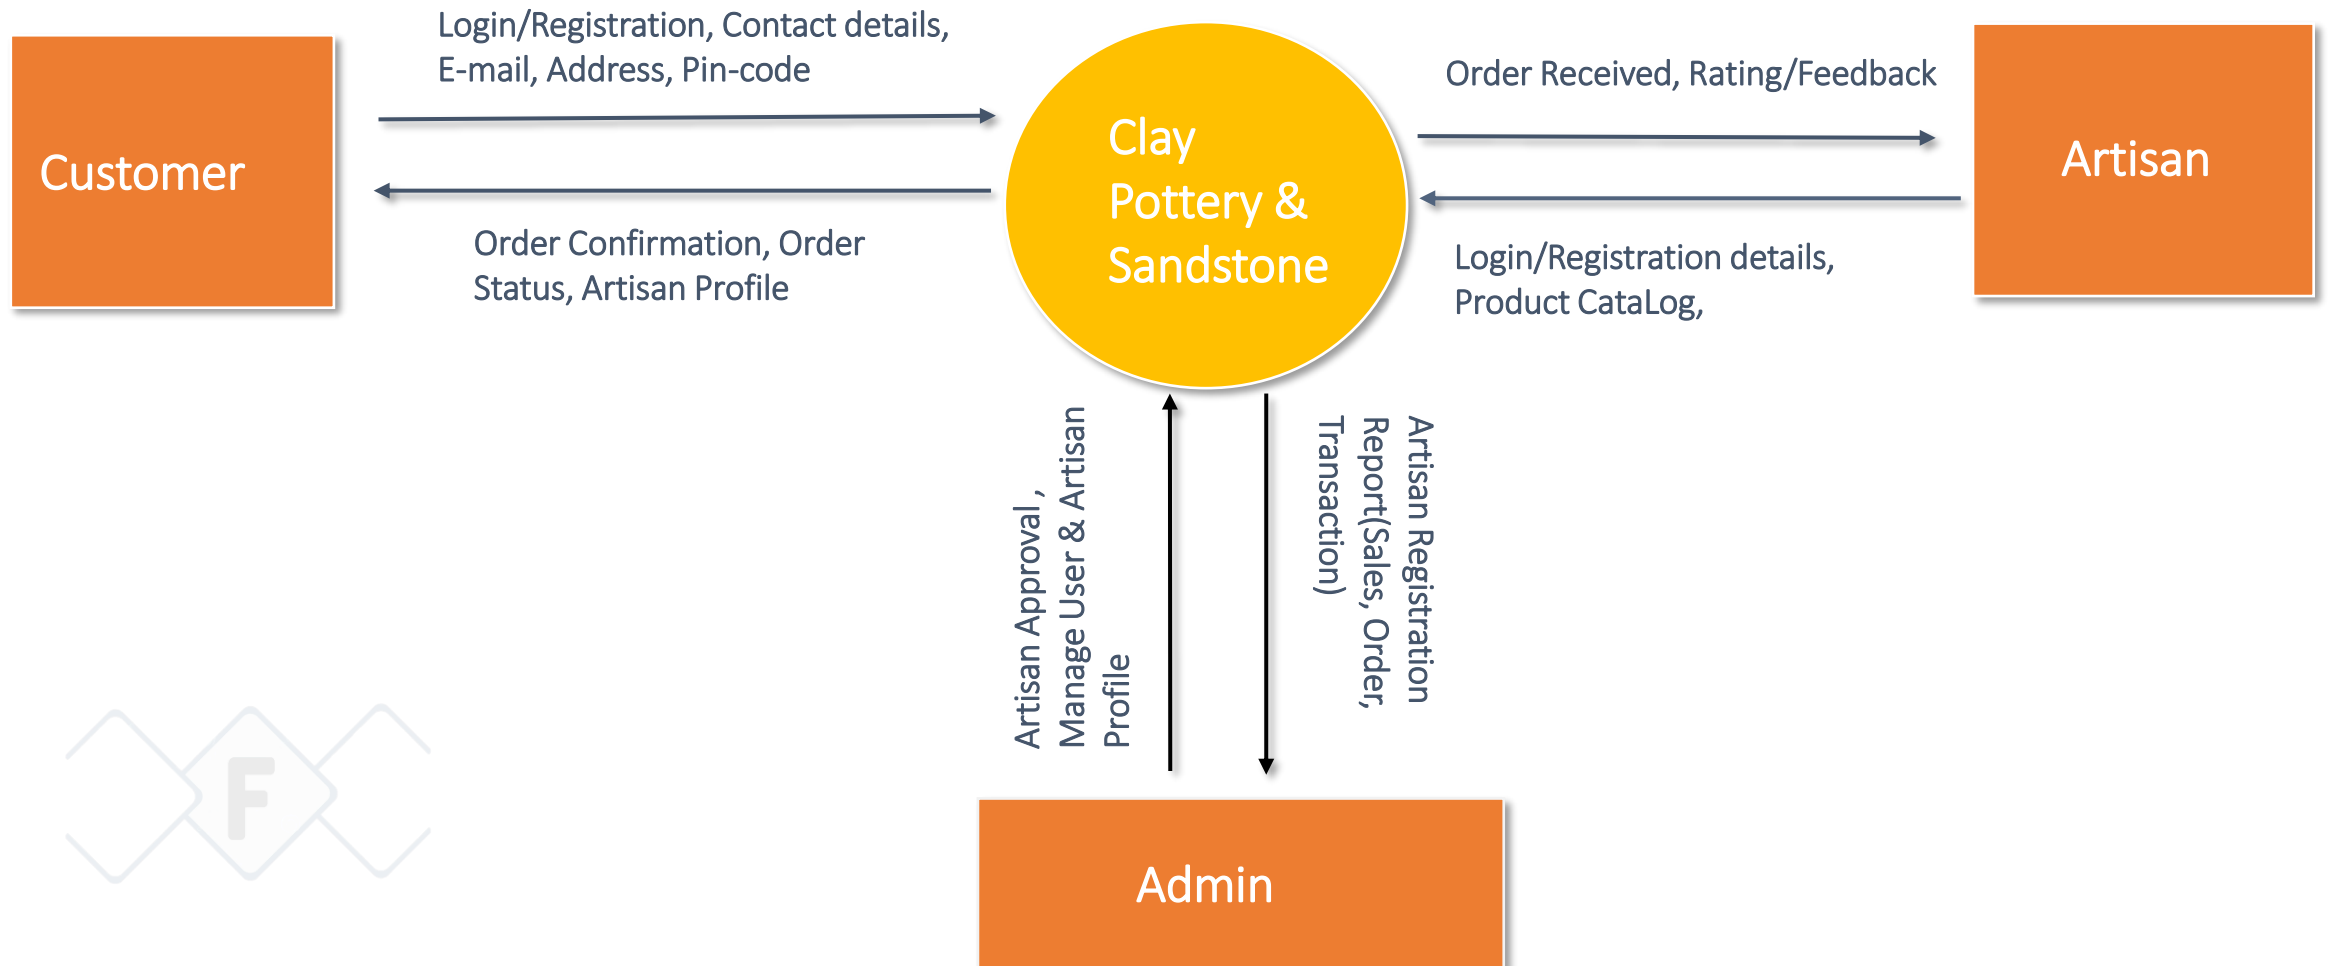

# Hardware

- Processor: Intel Core i3 / i5
- RAM: Minimum 4GB and (Recommended 8GB)
- Storage: 256GB SSD or 512GB HDD

# Software

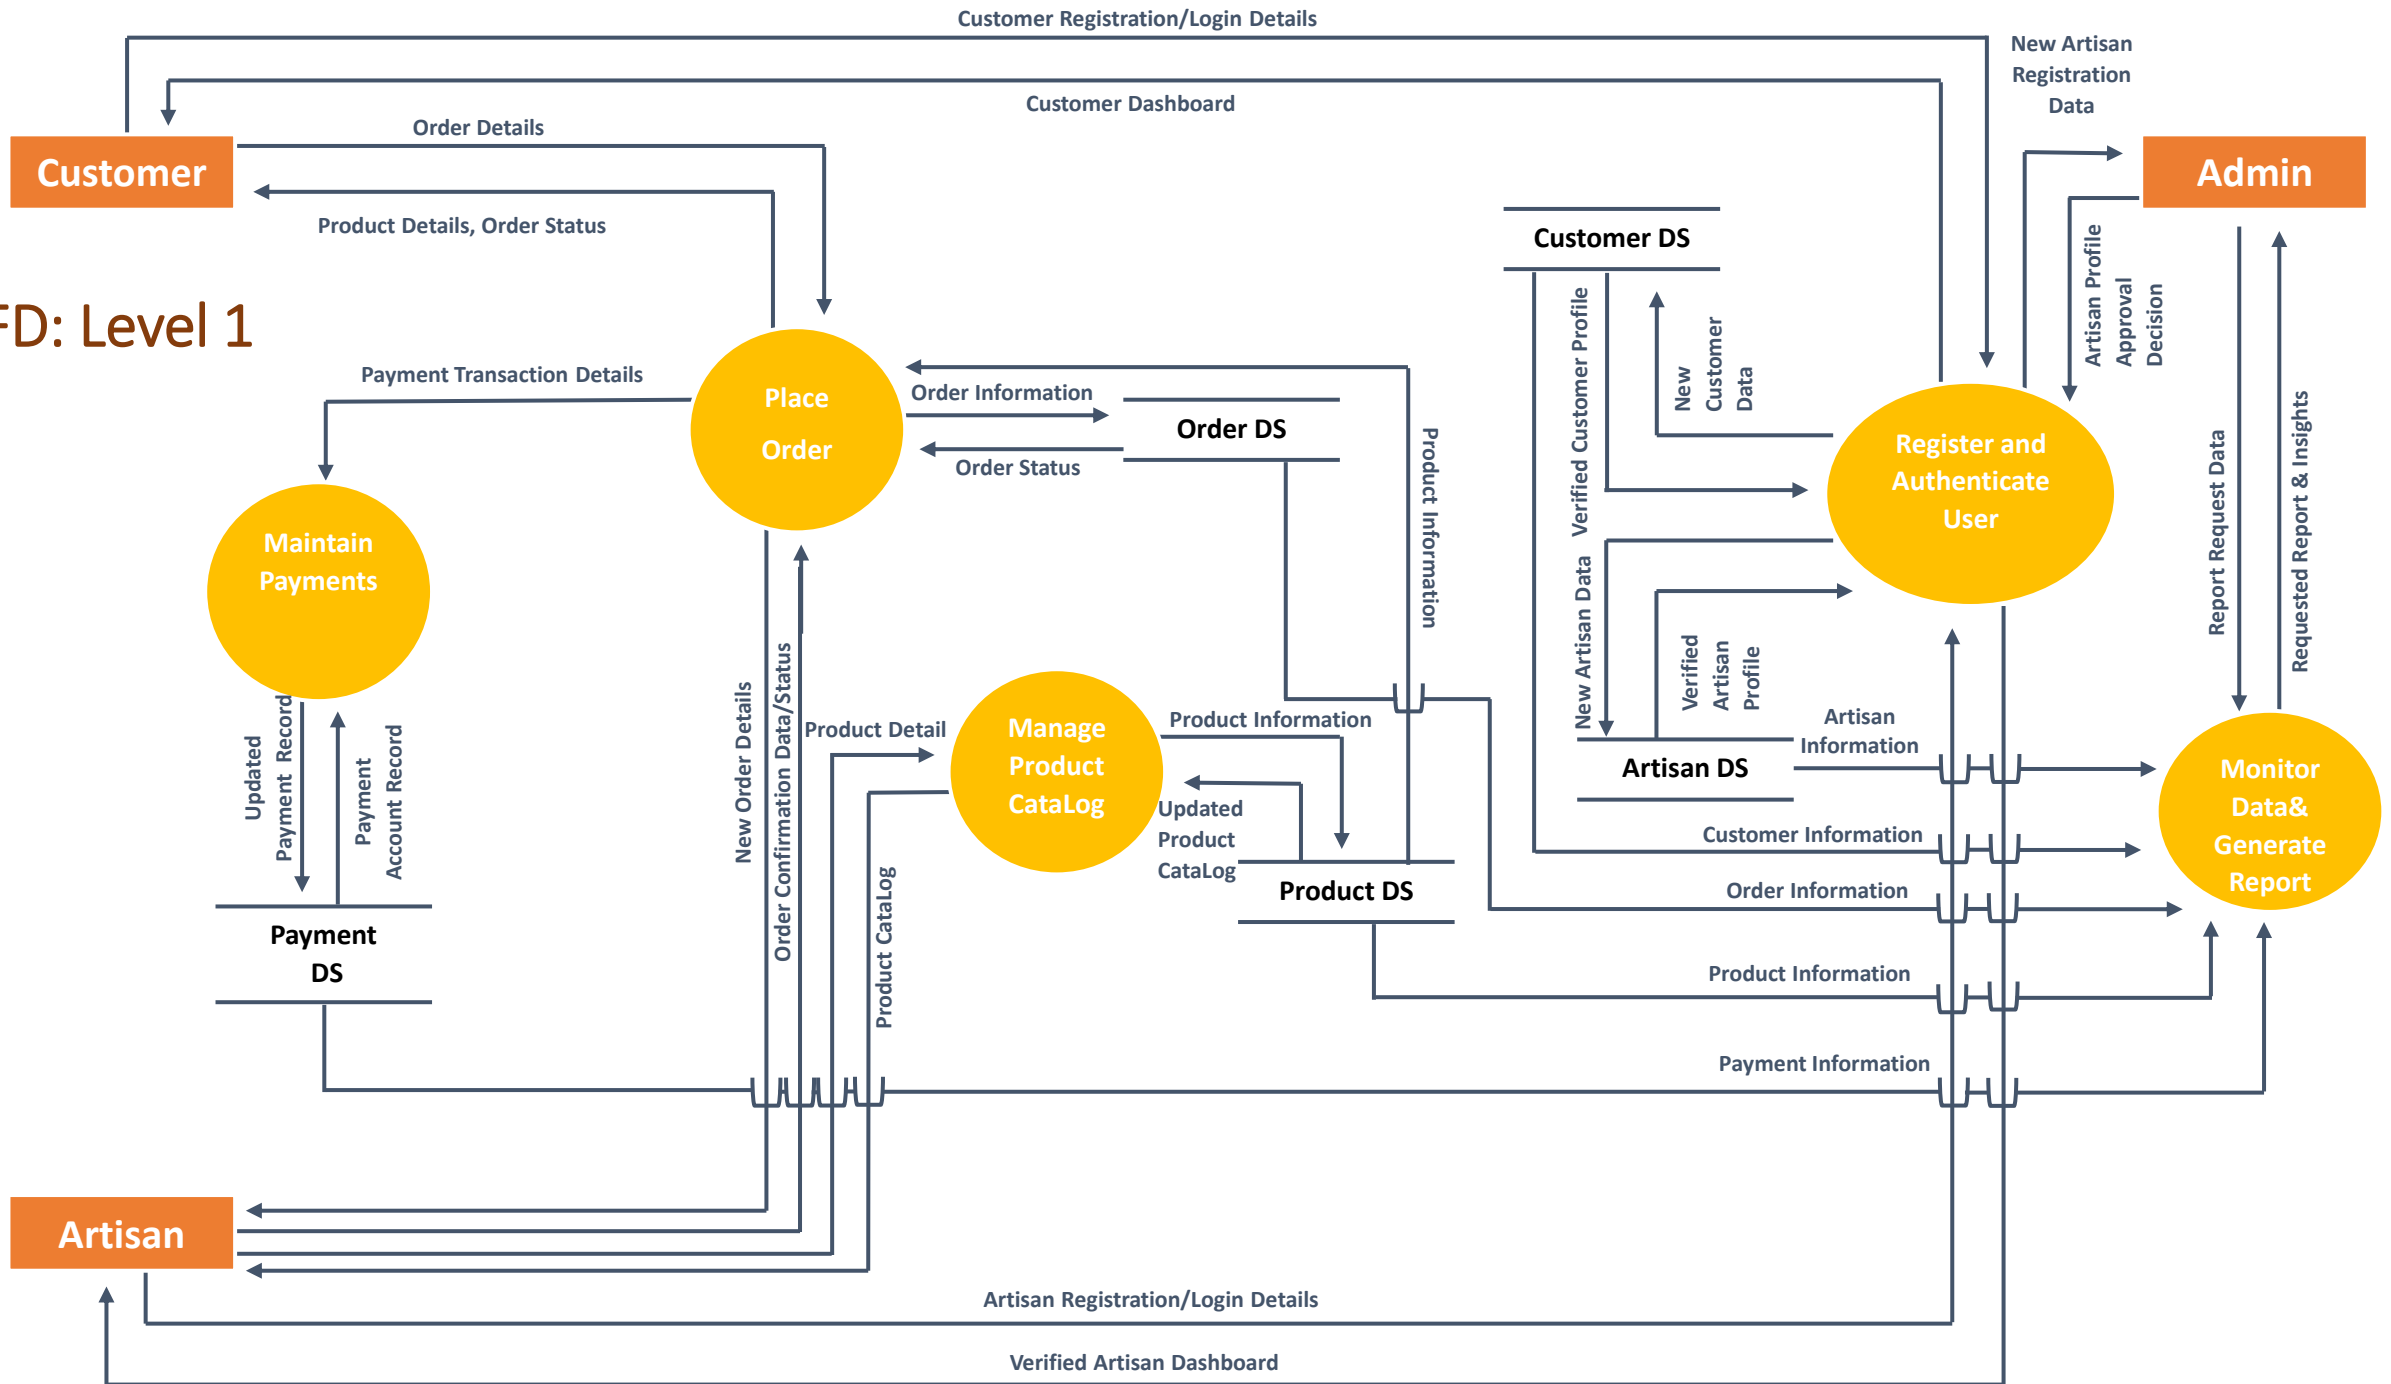

- Operating System: Windows 10 / 11 or Linux
- Frontend: HTML, CSS, & JS
- Backend: Node.js / PHP
- Database: MySQL
- IDE/ Code Editor: VS Code
- Browser: Google Chrome, Microsoft Edge, Firefox
